Exception Item Processing

Countertop check scanners such as TellerScan or Buic check scanners have been used in a broad range of exception processing applications including re-scans, reject re-entry, return item processing, exception processing, etc. Often items that are rejected by large reader sorters, require MICR codeline validation or repair, or additional data entry will be processed with countertop check scanners due to their ease of use versus running exception items through high speed equipment. Other benefits of countertop check scanners for exception items are the accurate MICR readers, high quality images, and small footprint.

TellerScan and Buic check scanners have been leaders in exception item processing for many years. A broad range of solution providers include TellerScan or Buic scanners with every installation of image POD applications due to their ease of use, accurate MICR, footprint, and high quality images.
